1. Introduction & Understanding Your Needs

This proposal outlines the development of a modern, scalable e-commerce platform designed to meet your retail business needs for web and mobile users. Our solution focuses on delivering key functionalities for customers and comprehensive management tools for administrators.

About Buggcy

Buggcy specializes in building robust e-commerce platforms, particularly those requiring integrations with services like Stripe for payments and Shippo for shipping, while also supporting significant user bases of over 100,000 monthly users.

Challenges We Understand

- Build a modern e-commerce platform for retail business
- Support web and mobile users for browsing, accounts, orders
- Integrate secure payments via Stripe and shipping via Shippo
- Provide real-time delivery tracking functionality
- Develop an admin dashboard for inventory and sales analytics

Your Goals

Immediate: Establish core e-commerce functionalities for product display and user accounts.

Short-term: Enable secure transactions, order placement, and initial administrative controls.

Long-term: Ensure platform scalability, advanced analytics, and continuous performance optimization for sustained growth.

2. Project Overview & Scope of Work

We propose developing a full-featured e-commerce platform with customer-facing web and mobile interfaces, complemented by an intuitive admin dashboard. The system will support product browsing, secure transactions, order tracking, and comprehensive business management.

Key Features

- **Product Catalog & Browsing** — Intuitive display and search for products across web and mobile.
- **Secure Account Management** — User registration, login, profile updates, and order history.
- **Order Placement & Payments** — Streamlined checkout process with secure Stripe integration.
- **Real-time Delivery Tracking** — Integration with Shippo for live order status updates.
- **Admin Dashboard** — Comprehensive tools for inventory, product, and customer support management.
- **Sales Analytics** — Reporting and insights for business performance and trends.

Architecture Approach

We will implement a modular monolith architecture, hosted on managed cloud services with Docker containers, optimized for the \$50k+ budget and 3-6 month timeline. This design provides a strong foundation for scalability and efficient development without the complexity of a full microservices setup, leveraging managed PostgreSQL with read replica options and Redis for caching.

Recommended Tech Stack

Node.js

React

PostgreSQL

Redis

Docker

AWS (or similar managed cloud services)

Stripe API

Shippo API

SendGrid (for email notifications)

Cloudflare (CDN)

Scope of Work

Phase	Description	Duration
Discovery & Foundation	Requirements finalization, technical architecture, and core setup.	3 weeks
Customer Journey Core	Implement product browsing, user accounts, and cart functionality.	4 weeks
Transaction & Fulfillment	Integrate Stripe payments, order placement, and Shippo tracking.	4 weeks
Admin & Support Panel	Develop inventory, product, customer, and discount management tools.	4 weeks
Analytics & Enhancements	Implement sales analytics, SEO, and performance optimizations.	3 weeks

3. Timeline & Budget

Estimated total duration: **3-6 months**, targeting completion by **3 - 6 months**.

Milestones

Milestone	Target Date
Architecture Design Complete	Week 2
Core Customer UI/UX Implemented	Week 7
Payment Gateway Integrated	Week 11
Admin Dashboard MVP Ready	Week 15
Analytics & SEO Features Live	Week 18
Platform Launch Readiness	Week 20

Budget Breakdown

Item	Cost
Discovery & Planning	\$8,000
Frontend Development (Web & Mobile)	\$25,000
Backend & API Development	\$20,000
Database & Infrastructure Setup	\$7,000
Third-Party Integrations (Stripe, Shippo)	\$8,000
Quality Assurance & Testing	\$5,000
Project Management	\$7,000
Total Estimated Cost	\$50,000 - \$75,000

4. Team & Why Choose Us

Lead Solutions Architect

Defines overall system architecture

Full-Stack Developer

Implements core functionalities and integrations

Frontend Developer

Builds responsive web and mobile user interfaces

QA Engineer

Ensures software quality and bug identification

Project Manager

Oversees project execution and client communication

The chosen modern stack and experienced team are designed to efficiently deliver a robust e-commerce platform within the allocated budget and timeline. While the client's stated user scale of 100,000+ monthly users suggests enterprise-level architecture, the growth-tier budget necessitates a phased modular monolith approach for initial delivery and future scaling.

5. Next Steps

Please review this proposal at your convenience. We are available to discuss any questions, and upon your approval, a deposit will initiate the project kickoff.
